A REUSABLE TAGSET FOR THE MORPHOLOGICALLY RICH LANGUAGE IN CHANGE: A CASE OF MIDDLE RUSSIAN[1]

Lyashevskaya O. N. (olesar@yandex.ru)

National Research University Higher School of Economics;
Vinogradov Institute of the Russian Language RAS,
Moscow, Russia

The paper discusses the standardization efforts to create a morphological standard for the Middle Russian corpus, which is part of the historical collection of the Russian National Corpus (RNC). To meet the needs of different categories of corpus researchers as well as NLP developers, we consider two styles of the morphological annotation (RNC schema and Universal Dependencies schema). A number of specifications of the feature list proposed to facilitate data reusability, linking and conversion.

Key words: full morphology tagging, pos-tagging, lemmatization, tagset, historical corpora, Russian National Corpus, Universal Dependencies, Old Russian, Middle Russian

[1] The article was prepared within the framework of the Basic Research Program at the National Research University Higher School of Economics (HSE) and supported within the framework of a subsidy by the Russian Academic Excellence Project '5-100'.

МНОГОЦЕЛЕВОЙ МОРФОЛОГИЧЕСКИЙ СТАНДАРТ РАЗМЕТКИ ДЛЯ ЯЗЫКА С МЕНЯЮЩЕЙСЯ ГРАММАТИЧЕСКОЙ СТРУКТУРОЙ: СЛУЧАЙ СТАРОРУССКОГО КОРПУСА

Ляшевская О. Н. (olesar@yandex.ru)
Национальный исследовательский универтситет «Высшая школа экономики»; Институт русского языка им. В. В. Виноградова РАН, Москва, Россия

Статья посвящена созданию морфологического стандарта для разметки Старорусского корпуса, который входит в состав исторических корпусов Национального корпуса русского языка (НКРЯ). Для того, чтобы сделать разметку удобной для лингвистов, работающих с историческими и современными корпусами, а также для разработчиков систем автоматической обработки исторических текстов, мы предусматриваем две параллельные схемы морфологической разметки, в нотации НКРЯ и Универсальных зависимостей (Universal Dependencies). Предлагается ряд спецификаций тагсета для облегчения совмещения разметок разных корпусов, связывания и конвертирования данных.

Ключевые слова: лексико-грамматическая разметка, частеречная разметка, лемматизация, тагсет, исторические корпуса, Национальный корпус русского языка, древнерусский язык, старорусская письменность

1. Introduction

Middle Russian Corpus (MidRus) is part of the Russian National Corpus (http://ruscorpora.ru) included in the collection of historical corpora [Sichinava 2014]. The MidRus contains over 4,700 texts of different genres written mostly between 1,300 and 1,700 (over 7 million words). Up to now, only a simple search for word forms and their parts has been available in the corpus interface. The paper represents the first attempt to develop the full morphology annotation standard for the MidRus.

Tagging the parts of speech, inflectional grammatical categories, and lemmas in historical corpora is a challenging task, since from one period to another, the grammatical structure changes: some grammatical forms drop out of use whereas new categories and grammatical patterns appear, the structure of the intra- and interparadigmatic homonymy varies. Furthermore, grammar and lexicon varies across schools and manuscripts, the texts often have noticeable dialect and stylistic features as well as varying and unstable spelling. While developing the full morphology annotation of the MidRus, we take into account the academic interests of the different categories of users including:

- researchers in the Middle Russian period of the language;
- researchers of the older periods of Russian accustomed to the annotation schemas of the Old Russian RNC corpus (OldRus) and the Old Novgorodian/East Slavic birchbark letters RNC corpus (OldNovg);
- researchers of the modern language who are interested in the micro-diachrony studies and are used to the tagset of the RNC Main corpus (ModernRus);
- NLP researchers who would be likely to use the Middle Russian data in their computational experiments, including comparative ones based on various paleoslavic data collections.

What makes things more challenging is that the annotation standards for the corpora of the earlier period and the modern period of Russian are well established but differ with regard to the lists of tags, the boundaries of lexical classes to which they apply, attested combinations of tags representing particular grammatical forms, and lemmatization rules. Therefore, we need to adopt existing schemas while evaluating contradicting data and clarifying the boundaries of the phenomena.

The last, but not the least issue that deserves attention is data reusability and customization. In recent years, new cross-language standards have gained popularity in NLP as they allow one to accumulate data of different origin and reuse and deploy the language technologies developed in the community.

To meet these new trends, the morphological annotation standard of the MidRus adopts two tagsets in parallel:

- RNC-MidRus: RNC Middle Russian tagset close to those of the Main RNC corpus, Old Russian, and Old Novgorod corpora;
- UD-MidRus: Universal Dependencies (UD) tagset close to those of the UD-Church Slavic and UD-Russian data collections.

As for the tagset customization, we distinguish among the core annotation schema (RNC and UD), an extended schema (RNC-ext and UD-ext), and a simplified schema encompassing only a selection of tags shared by the UD-MidRus and other UD corpora (UD-s).

The paper is structured as follows. **Section 2** outlines the state of the art in the field of historical Russian corpora and available NLP technologies. **Section 3** focuses on the part-of-speech tagging, **Section 4** covers the core grammatical tags, and **Section 5** is devoted to the analytical forms. The optional tags, extended and simplified annotation schemas are discussed in **Sections 6**, **7**, and **8**, respectively. Unless otherwise stated, the paper will refer to the core annotation schema, and the UD tags will be explicitly marked UD, if needed.

2. Historical Russian corpora and tagging methods

In this section, we overview the known historical corpora for Russian and methods for their tagging. Apart from the MidRus, there are three diachronic corpora in the RNC: OldRus, OldNovg, and Church Slavic (ChurchSlav) corpus [Moldovan 2015]. The Old Russian corpus [Mishina, Pichkhadze 2015] is provided with manual lemmatization and morphological annotation. The tool Morphy [Arkhangelsky et al.

2014] suggests annotations known from the texts which were tagged before. The original (Russian) tags are then translated into the (latin) tags used by the RNC search engine. The tagsets of the OldNovg [Sichinava 2018] and ChurchSlav [Dobrushina et al. 2015] are similar to those used in OldRus but differ in details. The annotation of the OldNovg is done semi-manually whereas the ChurchSlav is tagged automatically. An additional annotation of ambiguous word boundaries, fragmented tokens and comments on possible interpretations is available in OldNovg and, to a lesser extent, in OldRus. Moreover, the analyses in the OldNovg are most theoretically motivated, since they are based on the foudational work by [Zaliznyak 2004].

The annotation of the Northern Russian hagiographic corpus SCAT [Alexeeva, Azarova 2013] is done manually and follows an in-house extension of the TEI schema [Alexeev 2011]. The annotation features labeling the declension types.

The web page of the Regensburg Russian Diachronic Corpus mentions a "best bet" method based on the output of three taggers: Regensburg Old Church Slavonic tagger, Regensburg Old Russian guesser, and the modern Russian model of TreeTagger. [Meyer 2011] adds that the main source is the annotation projection from modern translations.

The corpus Manuscript [Baranov et al. 2007] is partially tagged using a sophisticated rule-based pipeline which is powered by the Old Russian grammatical dictionary, modern grammatical dictionary, and a dictionary of pseudo-units. The tool carries out lemmatization and provides normalized orthographic representations.

The TOROT treebank [Eckhoff, Berdičevskis 2015] is an Old Russian add-on to the PROIEL Old Church Slavonic (OCS) treebank, which uses the same annotation environment and tagset. The texts are tagged manually, lemmas and annotations being provided with the aid of statistical preprocessing [Berdičevskis et al. 2016]. Currently, the data are released offline in MULTEXT-East XML format, and the PROIEL OSC data are also converted into the UD-CONLL format (the Old Russian TOROT data are planned to be released in UD in 2019).

To sum up, the morphological tagsets for many corpora described above are hardly available (see also detailed reviews in [Mitrenina 2014], [Eckhoff forthc.]). The most popular tagset is RNC (which exists in a few slightly different versions); MULTEXT-East and UD schemas are most accessible for NLP purposes due to the open license of the TOROT data.

Among the tagging methods, labeling by precedents, dictionary- and rule-based systems, and the projection of the modern Russian annotations are widely used. However, remarkably, other methods pave the way for the statistical learning: [Berdičevskis et al. 2016] compares the output of the HMM-based probabilistic tagger TnT and a hybrid system that makes use of the grammatical dictionary. [Scherrer et al. 2018] run computational experiments using conditional random fields method (CRF, tagger MarMoT) and deep neural network learning (char-embedding BLSTM). It is worth noting that since the amount of machine readable data is very modest and the historical data do not have a homogeneous structure with respect to their tagsets, this could potentially foster the interest of NLP developers to the material. Thus, the harmonization of data annotation is obviously crucial for improving the quality of tagging.

3. Parts of speech

The lists of part-of-speech (pos) tags and core grammatical features is available at: https://github.com/olesar/UD_MidRussian/blob/master/MidRussianUD.md. The document also reports the mapping between the RNC and UD tags. To evaluate the mismatches in the corpus annotation practice, we compared all attested combinations of pos-tags and features as well as their association with lemmas (lexical coverage) in OldRus, OldNovg, TOROT, UD-Church Slavic, and ModernRus.

In general, the RNC pos-list can be mapped to the UD UPOS list almost straightforwardly. The pos-tags for adjectives (A), ordinal numerals (ANUM), and the most part of predicative words (PRAEDIC, see below) are mapped to ADJ in UD; the pos-tags for adverbs and parenthetic words (ADV, ADVPRO, PARENTH) are mapped to ADV in UD. The noun tags (S in RNC) are mapped to NOUN (common nouns) and PROPN (proper nouns), and the verb tags (V in RNC) are splitted between VERB and AUX (auxiliaries) in UD. The RNC tag CONJ is splitted between CCONJ (coordinate conjunction) and SCONJ (subordinate conjunction). The non-words (NONLEX) are splitted into X (foreign words, unknown words) and SYM (symbols). Besides that, the punctuation marks are explicitly tagged PUNCT in UD.

In the remainder of the section, we consider the mismatches in the annotation schemas with respect to the lexical coverage of pos categories in RNC and UD.

3.1. Pronominal words

И, *е*, *я* are tagged `spro` (UD: `pron`), the same way as in OldRus. Similarly, *иже*, *еже*, *яже* are tagged SPRO in RNC and PRON in UD. (In OldRus, they are tagged eigher APRO or SPRO, but we follow the principle to label a lemma uniformly as much as possible).

The relative pronouns *который*, *кыиждо*, *кыиже* are tagged APRO in RNC and PRON in UD. The reason is that they have the morphological properties of an adjective and the syntactic properties of a noun (nominal head), and this solution has already been implemented in the modern Russian UD [Droganova et al. 2018].

The possessives *его*, *ея*, *ихъ*, etc. are tagged as the Genitive forms of *онъ*, *оно*, *она*, *онъ*, *они*: SPRO, `gen` (UD: PRON, `Case=Gen`). (In OldRus, they are tagged as the Genitive forms of *и*; in ModernRus, they are tagged as indeclinable adjectival pronominals *его*, *ее*, *их*).

The list of APRO (UD: DET) includes:

- interrogative, relative, negative adjectival pronouns, quantifiers: *каковый*, *никакий*, *вьсь*;
- deictic (demonstrative) words: *сей*, *овъ*, *таковый*, etc.;
- possessive adjectival pronouns: *мой*, *свой,* etc.

The numeral *одинъ* is tagged ANUM in RNC and NUM in UD. In tagging it ANUM, we follow the practice of ModernRus (*один* has an adjective-like paradigm and is used as an attribute: for example, in the Nominative, it does not govern the Genitive case of the noun phrase compared to other numerals, see [Zaliznyak 2003]). However, in the UD treebanks the pos-tag NUM is applied consistently to the lexical equivalents of *один*. In OldRus, *одинъ* is labeled NUM as well.

3.2. Predicative words

Since there is no general mapping for the RNC PRAEDIC class to UPOS tags in UD, we use the conventions similar to those of the modern Russian UD standard:

- *-о*, *-е/-ѣ* forms (cf. (*ночью*) *тяпло*, *пригоже*, *явно*) that have corresponding adjectival forms are tagged as the short neutral forms of adjectives (UD: ADJ, `Gender=Neut, Number=Sing, Variant=Short`);
- the modal words—*можно*, *льзх*, *надобно*, *уне*—and the negative existentials *нхтъ*, *нх* are tagged VERB in UD;
- nouns such as *пора* used predicatively (cf. *пора идти*) are tagged as s in RNC and NOUN in UD;
- interjections, onomatopoeic words used predicatively are tagged as INTJ.

3.3. Auxiliaries

AUX in UD is used to tag:

- the auxiliary use of *быти*, *имѣти*, *хотѣти* in the analytical verb forms; this also includes the conditional markers *бы*, *бъ*—originally, the forms of *быти*, too, which got grammaticalized as indeclinable particles by the end of the Middle Russian period;
- the copula use of *быти* in nominal clauses;
- the reflexive markers (clitics) *си*, *ся*.

Only the existential and locative uses of the verb *быти* are tagged VERB in UD.

In the RNC schema, *бы* and *бъ* are subject of a double tagging strategy: they are labeled as verbs (lemma *быти*) and particles.

3.4. Named entities

The patronymics, last (family) names, nicknames and family nicknames and the like are tagged s (UD: PROPN): *Васильевичю*, *Колюбакинымъ*. This also applies to naming formulae with non-agreeing and agreeing possessive forms such as *Ивану Ильину сыну Челищева*, *Семену Васильеву сыну Власьеву*. The only exception are forms with full adjectival endings such as *Борисовую* in *княгиню Борисовую* and *Ондрѣевскую* in *Ефросинию, княж Ондрѣевскую жену Ивановича* which are considered adjectives (cf. the same practice in OldRus: *бабы* (*своеи*) *Романовои*). Note that in TOROT, the patronymics are sometimes considered adjectives.

4. Core grammatical tags

This section highlignts only key grammatical categories that distinguish the annotation schema of MidRus from those of OldRus or ModernRus.

4.1. Animacy

Animacy (`anim`; UD: `Animacy=Anim`) is tagged in the Accusative construction in which the form of Accusative is equal to the Genitive form, cf. *брата нашег*[*о*] *молодшег*[*о*]. In OldRus, such forms aree tagged `accgen`. The opposite case, when the Accusative case form is equal to the Nominative form, is not marked in MidRus.

4.2. L-form (indeclinable perfective participle)

L-participles (cf. *взялъ*) are tagged `perf` (UD: `VerbForm=PartRes, Tense=Past`), to distinguish them from other participles (cf. *взявъ*: `past partcp`; UD: `VerbForm=Part, Tense=Past`). The tense tag in UD will allow one to map the MidRus l-forms to the ModernRus past forms. L-forms are used both on their own and within the analytical forms, see below.

4.3. Gerundive (indeclinable adverbial participle)

Following [Zaliznyak 2004], forms such as *уповая*, *слышев* are considered indeclinable gerundives: `ger` (UD: `VerbForm=Conv`).

5. Analytical forms

The analytical forms are annotated as two (or more) tokens cross-linked at the morphological (in OldRus) and syntactic (in UD) level. All tokens are tagged `analyt` (UD: `Analyt=Yes`) and the grammatical features of the analytical form as a whole are labeled on the content word, cf. the annotation of the clause (1) *а будет не дошла* ‘And if it won’t reach (you)’ in RNC (**Fig. 1**) and UD (**Fig. 2**).

(1)
```
а       <ana lex="а" gr="CONJ"></ana>
будет   <ana lex="быти" gr="V,3p,act,analyt,fut,indic,intran,sg" gr_ext="IN:FUT2+3312"></ana>
не      <ana lex="не" gr="PART"></ana>
дошла   <ana lex="доити" gr="V,act,analyt,f,fut2,intran,perf,pf,sg" gr_ext="IN:FUT2+3310"></ana>
```

Figure 1: A sample annotation in RNC-MidRus

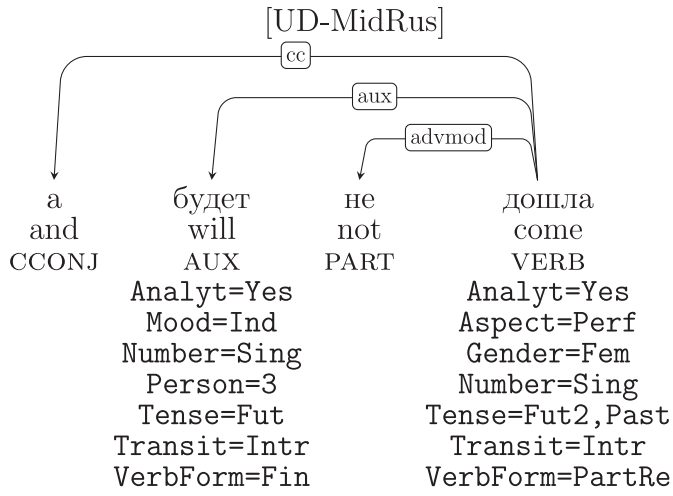

Figure 2: A sample annotation in UD-MidRus

In example (1), number, person, and future tense are labeled on the auxiliary *будет*: `sg, 3p, fut` (UD: `Number=Sing, Person=3, Tense=Fut`), and gender, number, l-form are labeled on the content verb *дошла*: `f, sg, perf` (UD: `Gender=Fem, Number=Sing, Tense=Past, VerbForm=PartRes`): these are the intrinsic grammatical values of the tokens. The content word is also labeled by the tense of the whole analytical form `fut2` (UD: `Tense=Fut2`). Furthermore, *будет* is tagged AUX (part of speech) and `aux` (dependency relation) in UD.

The list of analytical forms includes:

- analytical future (new form, attested starting from the 1600s): infinitive + the future form of *быти* (*буду*, *будешь*), cf. *буду просить*: in new future forms, the content verb is tagged `fut` (UD: `Tense=Fut`);
- future 1: infinitive + the auxiliary nonpast forms of *хотѣти* and *имѣти*, cf. имет *обидѣти*: in: in the future 1 forms, the content verb is tagged `fut1` (UD: `Tense=Fut1`);
- future 2: l-form + the future form of *быти* (*буду*, *будешь*), cf. *боудеш*[ь] *послал*, *боудоу задѣла*: in the future 2 forms, the content verb is tagged `fut2` (UD: `Tense=Fut2`). Note that in OldRus, the analytical forms with почати, *начати*, *учати*, *стати*, *яти* are also labeled as the future 1 or future 2 forms, but we do not consider them as such in MidRus;
- analytical perfect: l-form and the 1st and 2nd person auxiliary in the present tense (*есмь*, *еси*, etc.), cf. *взял еси*;
- pluperfect (plusquamperfect): l-form + the perfect form of *быти*, cf. *дал еси был*, the content verb is tagged `pqperf` (UD: `Tense=Pqp`);
- subjunctive (conditional): l-form + *бы*, *бъ*, other aorist forms of *быти* (or conjunctions that incorporate *-бы*: *чтоб*(*ы*), *абы*, etc.), cf. *я бы сталъ*, *чтоб онъ пожаловалъ*: in conditional forms, the content verb is tagged `cond` (UD: `Mood=Cnd`);

- subjunctive (conditional) 2: l-form + *бы еси*, *бы есте* (2nd person forms of *быти*), cf. *держали бы есте* (*веру християнскую*): in conditional 2, the content verb *бы* is tagged `cond2` (UD: `Mood=Cnd2`).

The optative construction (*да* + non-past), the periphrastic comparative constructions of adjectives and adverbs are not considered analytical forms, nevertheless, they can be labeled with specific optional tags.

6. Optional tags

6.1. Features not available in automatic annotation

The following categories used of OldRus and OldNovg can be identified only in a particular context, often with the assistance of encyclopedic knowledge. In MidRus, they are used optionally in manual annotation:

- `as _ S` (UD: `AdjType=Subst`)—substantivized use;
- `as _ persn` (UD: `AdjType=Persn`, `NounType=Persn`)—used as a personal name. In particular, old nicknames such as *Мономахъ* are not counted as the last names and tagged `as _ persn`;
- `as _ topn` (UD: `NounType=Topon`)—used as a toponym;
- `as _ ethn` (UD: `NounType=Ethn`)—used as an ethnonym;
- `as _ ADV` (UD: `NounType=Adv`, `AdjType=Adv`)—used as an adverb, cf. (*придоша Ветроу*) *вечеръ*, (*по*) *готовоу*;
- `as _ PART` (UD: `VerbType=Part`)—used as a particle, cf. *хотя*;
- `as _ PARENTH` (UD: `AdvType=Parenth`; pos-tag PARENTH in RNC-ext, see below)—parenthetical use;
- `as _ PRAEDIC` (UD: `AdjType=Praedic`; pos-tag PRAEDIC in RNC-ext)—predicative use;
- `as _ deb` (UD: `VerbType=Debit`)—used as a debitive, cf. *да не погубиши мьзды своеа*.

The following tags are used optionally and only in the RNC-style annotation:

- `husbn`—distinguishes the name given by husband's name from patronymics, cf. OldNovg (*оу*) *тоудоровъи*;
- `in _ persn`—used within a personal name, cf. *анастасу корсунянину*;
- `in _ ethn`—used within an ethnonym, cf. *Черніи Клобуци*;
- `in _ topn`—used within a geographic name, cf. (в) *Константинъ градъ*;
- `in _ ADV`—used in an adverbial phrase, cf. *тако же*;
- `in _ NUM`—used within a complex numeral, cf. *двъма на десяте*;
- `in _ CONJ`—used within a multitoken conjunction, cf. *егда како*;
- `in _ PR`—used within a multitoken preposition, cf. *в мъсто*.

In UD, there are ways to encode most of such cases with the dependency relation tags (e. g. `flat:name` and `fixed`).

6.2. Spelling and non-standard variants

The feature `abbr` (UD: `Abbr=Yes`) is used to tag abbreviated words including those marked by titlo.

- The feature `ciph` is used in RNC schema to label cardinal and ordinal numerals expressed by (Euro-Arabic) digits and Cyrillic letters. In UD-MidRus, the corresponding tag `NumForm=Digit` is used to label cardinal and ordinal numerals expressed by (Euro-Arabic) digits (*за 5 верстъ, 5-ти дней, лета 7030-го июля в 9 день*);
- `NumForm=Cyril`—used to tag numerals expressed by Cyrillic letters (*КЕ ал, по Д чысло*);
- `NumForm=Word`—used to tag numerals expressed by words (*одинъ, первый, лѣта семь тысячь девятаго*).
- The feature `distort` (UD: `Typo=Yes`) is used to label distorted words and words guessed by the editors of the historical manuscrupts. Specific cases include (RNC-style only):
- `damaged`—guessed words (if the text segment is damaged);
- `crossed _ out`—crossed out, cf. OldRus: (*и ко полотьску*)
- `redundant`—redundant word (*не не сподобилъ же еси*). Note that in UD, the feature `Echo` can be used to label various kinds of repetitions.

The feature `anom` (not tagged in UD) is used to tag grammatically anomalous forms. However, what is considered 'grammatically anomalous' in the historical data is controversial and theory-specific. Therefore, this tag should be used with caution.

Finally, `oov` (cf. `bastard` in ModernRus, not tagged in UD) is a specific kind of tags which is used to label words not seen in the training data or the grammatical dictionary of the tagger.

7. Extended annotation schema

We introduce the notion of cross-features (or x-features) that can be added into the schema to make the annotations in different corpora comparable. For example, in micro-diachronic studies, the data of the modern language are compared against the historical data. Even if a certain grammatical category is under development and it is not evident if it is present or absent in the data, x-features allow one to look for the potentially interesting patterns. In the current Middle Russian standard RNC-ext, the x-features include:

- `anim$` and `inan$` (UD: `Animacy[lex]=Anim, Animacy[lex]=Inan`): classifying features that correspond to anim and inan in the ModernRus annotation. This category is not to be mixed with `anim` (UD: `Animacy=Anim`) that is applicable only to the Accusative constructions (see above). There are cases in which the lexically animated nouns (`anim$`) are not tagged as `anim`;
- the transitivity tags `tran` and `intr` (UD: Transit=Tran, `Transit=Intr`). The transitivity is tagged often inconsistently in modern corpora, and the situation is even worse in historical corpora. However, this is an interesting category under development that allows a user to study various morphosyntactic phenomena.

Another example is the use of cross-features to make the data conversion between different formats more straightforward. So, in the intermediate schema UD-ext, an extended list of parts of speech is used which includes ANUM, PRAEDIC, PARENTH. Further, a number of cross-features under the category NounType are introduced in UD-ext to reflect RNC tags such as `persn, patrn, famn, zoon, ethn, topon` (e.g. NounType=Ethn).

8. Simplified annotation schema

An alternative option to make data compatible is reducing the lists of tags. This is particularly useful in NLP evaluation tasks since the dominance of features carefully designed for human research but rarely attested in corpora can cause the drop in tagging performance. In order to make the tagsets of historical corpora available in UD (UD Church Slavic (UD-PROIEL), UD-TOROT and UD-MidRus) compatible, the following features can be excluded from annotation:

- `Aspect` (verb aspect)
- `Reflex` (reflexivity labeled on verbs and pronound)
- `Animacy` (Acc=Gen)
- `PronType` (pronominal type)
- `Variant` (long/short forms)
- `Strength` (a rough equivalen for Variant in UD-PROIEL/TOROT)

Except for Variant/Strength and Animacy, these features are lexical (classifying) and do not add to the identification of which paradigm cell the form fills. Obviously, extended and optional features are out of the simplified list as well.

In addition, the tense forms of aorist (`Tense=Aor`) and imperfect (`Tense=Imp`) should be relabeled as `Tense=Past` according to the universal UD guidelines (and thus mirroring the annotation in UD-PROIEL/TOROT).

9. Conclusion

We have presented the annotation standard for the Middle Russian corpus, detailing guidelines to the tagging of part-of-speech and morphological features in RNC and UD schemas and introducing a mapping between the RNC and UD tags. We distinguish between core, extended and simplified tagsets and show that different categories of users can benefit from them.

The annotation schemas were evaluated and corrected while doing the manual annotation of the MidRus gold standard [Lyashevskaya 2018], on the one hand, and carrying out computational experiments in automatic tagging and training data amplification [Scherrer et al. 2019], on the other hand. The test sample was annotated manually in both standards, RNC and UD, in parallel. After data conversion from RNC to UD-s, the inter-annotator agreement was calculated over a total of 400 tokens. The ratio of equivalent annotations was considerably high (95%).

A pilot version of the gold standard MidRus data is released with open license in Universal Dependencies, v2.4.

Acknowledgements

We are grateful to Irina Juryeva, Roman Ilushin, Maria Skachedubova, Elizaveta Bunina, and Dmitri Sitchinava who contributed to the annotation of the Middle Russian gold standard data and revision of the annotation guidelines. We would also like to thank Anna Pichhadze, Alexandr Moldovan, Vladimir Plungian, Roman Krivko, Yves Scherrer, Achim Rabus, Hanne Eckhoff for fruitful discussion and advice.
